SUBSTITUTED N-[(AMINOIMINOMETHYL OR  
AMINOMETHYL)PHENYL]PROPYL AMIDES

10 Field of the Invention

15 The compounds of formula I exhibit useful pharmacological activity and accordingly are incorporated into pharmaceutical compositions and used in the treatment of patients suffering from certain medical disorders. More especially, they are Factor Xa inhibitors. The present invention is directed to compounds of formula I, compositions containing compounds of formula I, and their use, which are for treating a patient suffering from, or subject to, conditions which can be ameliorated by the administration of an inhibitor of Factor Xa.

20 Factor Xa is the penultimate enzyme in the coagulation cascade. Both free factor Xa and factor Xa assembled in the prothrombinase complex (Factor Xa, Factor Va, calcium and phospholipid) are inhibited by compounds of formula I. Factor Xa inhibition is obtained by direct complex formation between the inhibitor and the enzyme and is therefore independent of the plasma co-  
25 factor antithrombin III. Effective factor Xa inhibition is achieved by administering the compounds either by oral administration, continuous intravenous infusion, bolus intravenous administration or any other parenteral route such that it achieves the desired effect of preventing the factor Xa induced formation of thrombin from prothrombin.

30 Anticoagulant therapy is indicated for the treatment and prophylaxis of a variety of thrombotic conditions of both the venous and arterial vasculature. In the arterial system, abnormal thrombus formation is primarily associated with arteries of the coronary, cerebral and peripheral vasculature. The diseases  
35 associated with thrombotic occlusion of these vessels principally include acute myocardial infarction (AMI), unstable angina, thromboembolism, acute vessel closure associated with thrombolytic therapy and percutaneous transluminal

coronary angioplasty (PTCA), transient ischemic attacks, stroke, intermittent claudication and bypass grafting of the coronary (CABG) or peripheral arteries. Chronic anticoagulant therapy may also be beneficial in preventing the vessel luminal narrowing (restenosis) that often occurs following PTCA and CABG, and in the maintenance of vascular access patency in long-term hemodialysis patients. With respect to the venous vasculature, pathologic thrombus formation frequently occurs in the veins of the lower extremities following abdominal, knee and hip surgery (deep vein thrombosis, DVT). DVT further predisposes the patient to a higher risk of pulmonary thromboembolism. A systemic, disseminated intravascular coagulopathy (DIC) commonly occurs in both vascular systems during septic shock, certain viral infections and cancer. This condition is characterized by a rapid consumption of coagulation factors and their plasma inhibitors resulting in the formation of life-threatening clots throughout the microvasculature of several organ systems. The indications discussed above include some, but not all, of the possible clinical situations where anticoagulant therapy is warranted. Those experienced in this field are well aware of the circumstances requiring either acute or chronic prophylactic anticoagulant therapy.

## SUMMARY OF THE INVENTION

This invention is directed to the pharmaceutical use of a compound of formula I below to inhibit the production or physiological effects of Factor Xa in the treatment of a patient suffering from a disease state associated with a physiologically detrimental excess of Factor Xa, where formula I is as follows:

$R_1$  and  $R_2$  are hydrogen or taken together are  $=NR_9$ ;

$R_3$  is  $-CO_2R_6$ ,  $-C(O)R_6$ ,  $-CONR_6R_6$ ,  $-CH_2OR_7$  or  $-CH_2SR_7$ ;

$R_4$  is a group of formula

or R<sub>4</sub> is hydrogen, alkyl, cycloalkyl, or cycloalkylalkyl;

5 R<sub>5</sub> is alkyl, alkenyl, optionally substituted aryl or optionally substituted heteroaryl;

R<sub>6</sub> is hydrogen or lower alkyl;

10 R<sub>7</sub> is hydrogen, lower alkyl, lower acyl, aroyl or heteroaryl;

R<sub>8</sub> is hydrogen or lower alkyl;

15 R<sub>9</sub> is wherein R<sub>9</sub> is R<sub>10</sub>O<sub>2</sub>C-, R<sub>10</sub>O-, HO-, cyano, R<sub>10</sub>CO-, HCO-, lower alkyl, nitro, or Y<sup>1</sup>Y<sup>2</sup>N-, where R<sub>10</sub> is optionally substituted alkyl, optionally substituted aralkyl, or optionally substituted heteroaralkyl, and where Y<sup>1</sup> and Y<sup>2</sup> are independently hydrogen or alkyl;

A and B are hydrogen or taken together are a bond;

20

Ar is optionally substituted aryl or optionally substituted heteroaryl; and

n is 0, 1 or 2; or

25 a pharmaceutically acceptable salt thereof, an N-oxide thereof, a hydrate thereof or a solvate thereof.

### DETAILED DESCRIPTION OF THE INVENTION

30 As used above, and throughout the description of the invention, the following terms, unless otherwise indicated, shall be understood to have the following meanings:

#### Definitions

"Patient" includes both human and other mammals.

5 "Alkyl" means an aliphatic hydrocarbon group which may be straight or branched having about 1 to about 15 carbon atoms in the chain. Preferred alkyl groups have 1 to about 12 carbon atoms in the chain. Branched means that one or more lower alkyl groups such as methyl, ethyl or propyl are attached to a linear alkyl chain. "Lower alkyl" means about 1 to about 6 carbon atoms in the chain which may be straight or branched. The alkyl group may be substituted by one or more halo, cycloalkyl or cycloalkenyl. Exemplary alkyl groups include methyl, fluoromethyl, difluoromethyl, trifluoromethyl, cyclopropylmethyl, cyclopentylmethyl, ethyl, *n*-propyl, *i*-propyl, *n*-butyl, *t*-butyl, *n*-pentyl, 3-pentyl, heptyl, octyl, nonyl, decyl and dodecyl.

15 "Alkenyl" means an aliphatic hydrocarbon group containing a carbon-carbon double bond and which may be straight or branched having about 2 to about 15 carbon atoms in the chain. Preferred alkenyl groups have 2 to about 12 carbon atoms in the chain; and more preferably about 2 to about 6 carbon atoms in the chain. Branched means that one or more lower alkyl groups such as methyl, ethyl or propyl are attached to a linear alkenyl chain. "Lower alkenyl" means about 2 to about 4 carbon atoms in the chain which may be straight or branched. The alkenyl group may be substituted by one or more halo. Exemplary alkenyl groups include ethenyl, propenyl, *n*-butenyl, *i*-butenyl, 3-methylbut-2-enyl, *n*-pentenyl, heptenyl, octenyl and decenyl.

25 "Cycloalkyl" means a non-aromatic mono- or multicyclic ring system of about 3 to about 10 carbon atoms. Exemplary monocyclic cycloalkyl rings include cyclopentyl, fluorocyclopentyl, cyclohexyl and cycloheptyl. The cycloalkyl group may be substituted by one or more halo, methylene (H<sub>2</sub>C=) or alkyl. Exemplary multicyclic cycloalkyl rings include 1-decalin, adamant-(1- or 2-)yl and norbornyl.

35 "Cycloalkenyl" means a non-aromatic monocyclic or multicyclic ring system containing a carbon-carbon double bond and having about 3 to about 10 carbon atoms. Exemplary monocyclic cycloalkenyl rings include cyclopentenyl, cyclohexenyl or cycloheptenyl. An exemplary multicyclic

cycloalkenyl ring is norbornylenyl. The cycloalkenyl group may be substituted by one or more halo, methylene ( $H_2C=$ ) or alkyl.

"Heterocyclyl" means a non-aromatic monocyclic or multicyclic ring system of about 3 to about 10 ring atoms. Preferred rings include about 5 to about 6 ring atoms wherein one of the ring atoms is oxygen, nitrogen or sulfur. The heterocyclyl may be optionally substituted by one or more halo. Preferred monocyclic heterocyclyl rings include pyrrole, tetrahydrothiophenyl and tetrahydrothiopyranyl. The thio or nitrogen moiety of the heterocyclyl may also be optionally oxidized to the corresponding N-oxide, S-oxide or S,S-dioxide.

"Aryl" means aromatic carbocyclic radical containing about 6 to about 10 carbon atoms. Exemplary aryl include phenyl or naphthyl optionally substituted with one or more aryl group substituents which may be the same or different, where "aryl group substituent" includes hydrogen, alkyl, optionally substituted aryl, optionally substituted heteroaryl, aralkyl, hydroxy, hydroxyalkyl, alkoxy, aryloxy, aralkoxy, carboxy, acyl, aroyl, halo, nitro, cyano, carboxy, alkoxycarbonyl, aryloxy carbonyl, aralkoxycarbonyl, acylamino, aroylamino, alkylsulfonyl, arylsulfonyl, alkylsulfinyl, arylsulfinyl, alkylthio, arylthio, aralkylthio,  $Y^1Y^2N-$ ,  $Y^1Y^2N-$ ,  $Y^1Y^2N$ -alkyl-,  $CO-$  or  $Y^1Y^2NSO_2-$ , where  $Y^1$  and  $Y^2$  are independently hydrogen, alkyl, aryl, and aralkyl. Preferred aryl group substituents include hydrogen, alkyl, optionally substituted aryl, optionally substituted heteroaryl, hydroxy, acyl, aroyl, halo, nitro, cyano, alkoxycarbonyl, acylamino, alkylthio,  $Y^1Y^2N-$ ,  $Y^1Y^2NCO-$  or  $Y^1Y^2NSO_2-$ , where  $Y^1$  and  $Y^2$  are independently hydrogen and alkyl.

"Heteroaryl" means about a 5- to about a 10- membered aromatic monocyclic or multicyclic hydrocarbon ring system in which one or more of the carbon atoms in the ring system is/are element(s) other than carbon, for example nitrogen, oxygen or sulfur. The "heteroaryl" may also be substituted by one or more aryl group substituents. Exemplary heteroaryl groups include pyrazinyl, furanyl, thienyl, pyridyl, pyrimidinyl, isoxazolyl, isothiazolyl, quinolinyl, indolyl, and isoquinolinyl.

"Aralkyl" means an aryl-alkyl- group in which the aryl and alkyl are as previously described. Preferred aralkyls contain a lower alkyl moiety. Exemplary aralkyl groups include benzyl, 2-phenethyl and naphthlenemethyl.

"Hydroxyalkyl" means a HO-alkyl- group in which alkyl is as previously defined. Preferred hydroxyalkyls contain lower alkyl. Exemplary hydroxyalkyl groups include hydroxymethyl and 2-hydroxyethyl.

5

"Acyl" means an H-CO- or alkyl-CO- group in which the alkyl group is as previously described. Preferred acyls contain a lower alkyl. Exemplary acyl groups include formyl, acetyl, propanoyl, 2-methylpropanoyl, butanoyl and palmitoyl.

10

"Aroyl" means an aryl-CO- group in which the alkyl group is as previously described. Exemplary groups include benzoyl and 1- and 2-naphthoyl.

15

"Alkoxy" means an alkyl-O- group in which the alkyl group is as previously described. Exemplary alkoxy groups include methoxy, ethoxy, *n*-propoxy, *i*-propoxy, *n*-butoxy and heptoxy.

20

"Aryloxy" means an aryl-O- group in which the aryl group is as previously described. Exemplary aryloxy groups include phenoxy and naphthoxy.

25

"Aralkyloxy" means an aralkyl-O- group in which the aralkyl groups is as previously described. Exemplary aralkyloxy groups include benzyloxy and 1- or 2-naphthalenemethoxy.

30

"Alkylthio" means an alkyl-S- group in which the alkyl group is as previously described. Exemplary alkylthio groups include methylthio, ethylthio, *i*-propylthio and heptylthio.

"Arylthio" means an aryl-S- group in which the aryl group is as previously described. Exemplary arylthio groups include phenylthio and naphthylthio.

35

"Aralkylthio" means an aralkyl-S- group in which the aralkyl group is as previously described. An exemplary aralkylthio group is benzylthio.

"Y<sup>1</sup>Y<sup>2</sup>N-" means a substituted or unsubstituted amino group, wherein Y<sup>1</sup> and Y<sup>2</sup> are as previously described. Exemplary groups include amino (H<sub>2</sub>N-), methylamino, ethylmethylamino, dimethylamino and diethylamino.

5 "Alkoxycarbonyl" means an alkyl-O-CO- group. Exemplary alkoxycarbonyl groups include methoxy- and ethoxycarbonyl.

"Aryloxycarbonyl" means an aryl-O-CO- group. Exemplary  
10 arylloxycarbonyl groups include phenoxy- and naphthoxycarbonyl.

"Aralkoxycarbonyl" means an aralkyl-O-CO- group. An exemplary  
aralkoxycarbonyl group is benzyloxycarbonyl.

"Y<sup>1</sup>Y<sup>2</sup>NCO-" means a substituted or unsubstituted carbamoyl group,  
15 wherein Y<sup>1</sup> and Y<sup>2</sup> are as previously described. Exemplary groups are carbamoyl (H<sub>2</sub>NCO-) and dimethylaminocarbamoyl (Me<sub>2</sub>NCO-).

"Y<sup>1</sup>Y<sup>2</sup>NSO<sub>2</sub>-" means a substituted or unsubstituted sulfamoyl group,  
20 wherein Y<sup>1</sup> and Y<sup>2</sup> are as previously described. Exemplary groups are aminosulfamoyl (H<sub>2</sub>NSO<sub>2</sub>-) and dimethylaminosulfamoyl (Me<sub>2</sub>NSO<sub>2</sub>-).

"Acylamino" is an acyl-NH- group wherein acyl is as defined herein.

"Aroylamino" is an aroyl-NH- group wherein aroyl is as defined herein.  
25

"Alkylsulfonyl" means an alkyl-SO<sub>2</sub>- group. Preferred groups are those  
in which the alkyl group is lower alkyl.

"Alkylsulfinyl" means an alkyl-SO- group. Preferred groups are those in  
30 which the alkyl group is lower alkyl.

"Arylsulfonyl" means an aryl-SO<sub>2</sub>- group.

"Arylsulfinyl" means an aryl-SO- group.  
35

"Halo" means fluoro, chloro, bromo, or iodo. Preferred are fluoro, chloro  
or bromo, and more preferred are fluoro or chloro.

"Pro-drug" means a compound which may or may not itself be biologically active but which may, by metabolic, solvolytic, or other physiological means be converted to a biologically active chemical entity.

### Preferred Embodiments

A preferred embodiment of the invention is a method for treating a disease state capable of being modulated by inhibiting production of Factor Xa to a patient suffering from said disease state an effective amount of the compound of formula I .

10

A preferred compound aspect of the invention is the compound of formula I wherein  $R_1$  and  $R_2$  taken together are =NH.

15

Another preferred compound aspect of the invention is the compound of formula I wherein  $R_3$  is  $-\text{CO}_2\text{R}_6$ ,  $-\text{CH}_2\text{OR}_7$  or  $-\text{CH}_2\text{SR}_7$ ;

Another preferred compound aspect of the invention is the compound of formula I wherein  $n$  is 1.

20

Another preferred compound aspect of the invention is the compound of formula I wherein  $R_3$  is  $-\text{CO}_2\text{R}_6$  and  $R_6$  is lower alkyl.

Another preferred compound aspect of the invention is the compound of formula I wherein  $R_3$  is  $-\text{CH}_2\text{OR}_7$  or  $-\text{CH}_2\text{SR}_7$  and  $R_7$  is hydrogen or lower alkyl.

25

Another preferred compound aspect of the invention is the compound of formula I wherein  $R_1$  and  $R_2$  taken together are =NH and form an aminoiminomethyl on the phenyl moiety that is in the meta position to the position of attachment of the phenyl moiety to the propyl moiety.

30

Another preferred compound aspect of the invention is the compound of formula I wherein Ar is optionally substituted aryl.

35

Another preferred compound aspect of the invention is the compound of formula I wherein Ar is phenyl.

Another preferred compound aspect of the invention is the compound of formula I wherein R<sub>5</sub> is optionally substituted phenyl, optionally substituted biphenyl, optionally substituted naphthyl, or optionally substituted heterobiphenyl.

Another preferred compound aspect of the invention is the compound of formula I wherein R<sub>10</sub> is lower alkyl.

Included within the scope of formula I are compounds wherein R<sub>1</sub> and R<sub>2</sub> taken together are =NR<sub>9</sub>, wherein R<sub>9</sub> is R<sub>10</sub>O<sub>2</sub>C-, R<sub>10</sub>O-, cyano, R<sub>10</sub>CO-, optionally substituted lower alkyl, nitro, or Y<sup>1</sup>Y<sup>2</sup>N-. Such derivatives may themselves comprise the biologically active compound useful for treating a disease state capable of being modulated by inhibiting production of Factor Xa to a patient suffering from said disease state, or may act as pro-drugs to such biologically active compounds which are formed therefrom under physiological conditions.

Species according to the invention are selected from the following:

It will be apparent to those skilled in the art that certain compounds of formula I can exhibit isomerism, for example geometrical isomerism, e.g., E or Z isomerism, and optical isomerism, e.g., R or S configurations. Geometrical isomers include the cis and trans forms of compounds of the invention having alkenyl moieties. Individual geometrical isomers and stereoisomers within formula I, and their mixtures, are within the scope of the invention.

10

Such isomers can be separated from their mixtures, by the application or adaptation of known methods, for example chromatographic techniques and recrystallization techniques, or they are separately prepared from the appropriate isomers of their intermediates, for example by the application or  
5 adaptation of methods described herein.

The compounds of the present invention are useful in the form of the free base or acid or in the form of a pharmaceutically acceptable salt thereof. All forms are within the scope of the invention.

10

Where the compound of the present invention is substituted with a basic moiety, acid addition salts are formed and are simply a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free base form. The acids which can be used to prepare the acid addition salts  
15 include preferably those which produce, when combined with the free base, pharmaceutically acceptable salts, that is, salts whose anions are non-toxic to the patient in pharmaceutical doses of the salts, so that the beneficial inhibitory effects on Factor Xa inherent in the free base are not vitiated by side effects ascribable to the anions. Although pharmaceutically acceptable salts of said  
20 basic compounds are preferred, all acid addition salts are useful as sources of the free base form even if the particular salt, per se, is desired only as an intermediate product as, for example, when the salt is formed only for purposes of purification, and identification, or when it is used as intermediate in preparing a pharmaceutically acceptable salt by ion exchange procedures.

25 Pharmaceutically acceptable salts within the scope of the invention are those derived from the following acids: mineral acids such as hydrochloric acid, sulfuric acid, phosphoric acid and sulfamic acid; and organic acids such as acetic acid, citric acid, lactic acid, tartaric acid, malonic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid,  
30 cyclohexylsulfamic acid, quinic acid, and the like. The corresponding acid addition salts comprise the following: hydrohalides, e.g. hydrochloride and hydrobromide, sulfate, phosphate, nitrate, sulfamate, acetate, citrate, lactate, tartarate, malonate, oxalate, salicylate, propionate, succinate, fumarate, maleate, methylene-bis-B-hydroxynaphthoates, gentisates, mesylates,  
35 isethionates and di-p-toluoyltartratesmethanesulfonate, ethanesulfonate, benzenesulfonate, p-toluenesulfonate, cyclohexylsulfamate and quinate, respectively.

According to a further feature of the invention, acid addition salts of the compounds of this invention are prepared by reaction of the free base with the appropriate acid, by the application or adaptation of known methods. For example, the acid addition salts of the compounds of this invention are prepared either by dissolving the free base in aqueous or aqueous-alcohol solution or other suitable solvents containing the appropriate acid and isolating the salt by evaporating the solution, or by reacting the free base and acid in an organic solvent, in which case the salt separates directly or can be obtained by concentration of the solution.

The acid addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods. For example, parent compounds of the invention can be regenerated from their acid addition salts by treatment with an alkali, e.g. aqueous sodium bicarbonate solution or aqueous ammonia solution.

Where the compound of the invention is substituted with an acidic moiety, base addition salts may be formed and are simply a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free acid form. The bases which can be used to prepare the base addition salts include preferably those which produce, when combined with the free acid, pharmaceutically acceptable salts, that is, salts whose cations are non-toxic to the animal organism in pharmaceutical doses of the salts, so that the beneficial inhibitory effects on Factor Xa inherent in the free acid are not vitiated by side effects ascribable to the cations. Pharmaceutically acceptable salts, including for example alkali and alkaline earth metal salts, within the scope of the invention are those derived from the following bases: sodium hydride, sodium hydroxide, potassium hydroxide, calcium hydroxide, aluminum hydroxide, lithium hydroxide, magnesium hydroxide, zinc hydroxide, ammonia, ethylenediamine, N-methyl-glucamine, lysine, arginine, ornithine, choline, N,N'-dibenzylethylenediamine, chlorprocaine, diethanolamine, procaine, N-benzylphenethylamine, diethylamine, piperazine, tris(hydroxymethyl)-aminomethane, tetramethylammonium hydroxide, and the like.

Metal salts of compounds of the present invention may be obtained by contacting a hydride, hydroxide, carbonate or similar reactive compound of the

chosen metal in an aqueous or organic solvent with the free acid form of the compound. The aqueous solvent employed may be water or it may be a mixture of water with an organic solvent, preferably an alcohol such as methanol or ethanol, a ketone such as acetone, an aliphatic ether such as tetrahydrofuran, or an ester such as ethyl acetate. Such reactions are normally conducted at ambient temperature but they may, if desired, be conducted with heating.

Amine salts of compounds of the present invention may be obtained by contacting an amine in an aqueous or organic solvent with the free acid form of the compound. Suitable aqueous solvents include water and mixtures of water with alcohols such as methanol or ethanol, ethers such as tetrahydrofuran, nitriles such as acetonitrile, or ketones such as acetone. Amino acid salts may be similarly prepared.

The base addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods. For example, parent compounds of the invention can be regenerated from their base addition salts by treatment with an acid, e.g. hydrochloric acid.

As will be self-evident to those skilled in the art, some of the compounds of this invention do not form stable salts. However, acid addition salts are most likely to be formed by compounds of this invention having a nitrogen-containing heteroaryl group and/or wherein the compounds contain an amino group as a substituent. Preferable acid addition salts of the compounds of the invention are those wherein there is not an acid labile group.

As well as being useful in themselves as active compounds, salts of compounds of the invention are useful for the purposes of purification of the compounds, for example by exploitation of the solubility differences between the salts and the parent compounds, side products and/or starting materials by techniques well known to those skilled in the art.

The starting materials and intermediates are prepared by the application or adaptation of known methods, for example methods as described in the Reference Examples or their obvious chemical equivalents, or by methods according to this invention.

The present invention is further exemplified but not limited by the following illustrative examples which illustrate the preparation of the compounds according to the invention.

10

To a stirred solution of compound **2** (16.8 g; 89 mmol) in 200 mL of THF:MeOH (2:1) at room temperature is added 9 mL of 10 N NaOH solution dropwise.

- 15    After 2h, most of the solvent is removed in *vacuo* and 30 mL of 5N HCl is added. The resulting mixture is extracted several times with EtAc. The combined extracts are dried ( $\text{MgSO}_4$ ), filtered and concentrated to give 9.8 g (63%) of pure acid **3** as a white solid.

- 20     $^1\text{H}$  NMR ( $\text{CDCl}_3$ , d): 7.35 - 7.55 (m, 4H), 2.98 (t,  $J = 7.9$  Hz, 2H), 2.7 (t,  $J = 7.9$  Hz, 2H).

### EXAMPLE 4

#### Compound 4

25

To a stirred solution of the carboxylic acid **3** (8.2 g; 47 mmol) in DMF (0.5 mL) in dry  $\text{CH}_2\text{Cl}_2$  under  $\text{N}_2$  at room temperature is added oxalyl chloride (6.1 mL;

70 mmol) dropwise. After 1 hour, gas evolution ceased and the solvent and excess oxalyl chloride is removed *in vacuo*. The residue is redissolved in 100 mL of dry CH<sub>2</sub>Cl<sub>2</sub> and cooled to 0°C. Mercaptopyridine (5.6 g; 50 mmol) is added followed by triethylamine (7.9 mL; 56 mmol). The mixture is allowed to warm to r.t. and stirred for 1 hour. The mixture is diluted with CH<sub>2</sub>Cl<sub>2</sub> and washed with 1 N NaOH. The organic layer is dried (MgSO<sub>4</sub>), filtered and concentrated. The residue is chromatographed (eluent = 50% EtAc:Hexane) to give 5.12 g (84%) of the thioester 4 as a yellow oil.

<sup>1</sup>H NMR (CDCl<sub>3</sub>, d): 8.63 (d, J = 9 Hz, 1H), 7.7 - 7.8 (m, 1H), 7.27 - 7.62 (m, 6H), 3.05 (s, 4H).

##### Compound 6

- To a stirred solution of the thioester **5** (7 g; 26 mmol) in dry  $\text{CH}_2\text{Cl}_2$  (120 mL) under  $\text{N}_2$  at  $-78^\circ\text{C}$  is added  $\text{TiCl}_4$  solution (26.1 mL of 1 M solution in  $\text{CH}_2\text{Cl}_2$ ).
- 5 After 15 minutes, triethylamine (3.6 mL; 26 mmol) is added dropwise. The resulting mixture is allowed to stir for 1/2h at  $-78^\circ\text{C}$  and then a solution of imine **1** (4.42 g; 19 mmol in 20 mL  $\text{CH}_2\text{Cl}_2$ ) is added dropwise. The mixture is then warmed to  $0^\circ\text{C}$ . After 1.5 hours at this temperature, the mixture is quenched with saturated  $\text{NaHCO}_3$  solution and partitioned with water. The organic layer
- 10 is washed with 1 N  $\text{NaOH}$ , dried ( $\text{MgSO}_4$ ) and concentrated *in vacuo*. The crude product is chromatographed (eluent = 40% EtAc:hexane) to give 2.42 g (32 %) of a 5:1 mixture of trans- /cis- b -lactam **6a** and **6b** as a gum.

#### Major trans-Isomer **6a**

- 15  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , d): 7.2 - 7.6 (m, 11H), 6.8 (d,  $J = 11$  Hz, 2H), 6.65 (d,  $J = 15.8$  Hz, 1H), 6.2 (dd,  $J = 15.8, 7.9$  Hz, 1H), 4.32 (m, 1H), 3.72 (s, 3H), 3 - 3.42 (m, 3H).

#### 20 EXAMPLE 7 Compound **7**

- 25 To a stirred solution of **6a**, **6b** (1.5 g; 3.8 mmol) in 60 mL of THF/ $\text{CH}_3\text{CN}$  (1/3) at  $-20^\circ\text{C}$  is added a solution of ceric ammonium nitrate (CAN, 3.13g; 5.7 mmol in 10 mL water). After 15 minutes, another 1.5 g of CAN in 5 mL of water is added. After a further 30 minutes, the mixture is quenched with saturated  $\text{NaHCO}_3$

solution and allowed to come to room temperature. The resulting suspension is filtered through a bed of celite, washing the celite pads several times with  $\text{CH}_2\text{Cl}_2$  (total ca. 200 mL). The filtrate layers are separated and the organic layer dried ( $\text{MgSO}_4$ ), filtered and concentrated *in vacuo*. The crude product is chromatographed (eluent = 60% EtAc:hexane) to give 476 mg (43%) of pure *trans*-isomer **7a** together with 85 mg of a mixture of *cis*-**7b** and *trans*-**7a** isomers.

Major *trans* - isomer **7a**

Minor *cis* - isomer **7b**

<sup>1</sup>H NMR ( $\text{CDCl}_3$ , d): 7.21 - 7.52 (m, 9H), 6.62 (d,  $J = 15.8$  Hz, 1H), 6.45 (s, 1H), 6.1 (dd,  $J = 15.8, 7.9$  Hz, 1H), 4.46 (m, 1H), 3.7 (m, 1H), 3.02 - 3.17 (m, 1H), 2.8 - 2.93 (m, 1H).

EXAMPLE 8

Compound **8**

To a stirred solution of the *trans*-b-lactam **7a** in dry  $\text{CH}_2\text{Cl}_2$  under  $\text{N}_2$  at r.t. is added triethylamine (4.04 mL; 29 mmol) dropwise. Biphenylcarbonyl chloride (5.05g; 23.2 mmol) is then added followed by DMAP (50 mg). After 30 minutes the mixture is diluted with  $\text{CH}_2\text{Cl}_2$  and washed with 1 N HCl. The organic layer is then dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated. The crude product is chromatographed (eluent = 30% EtAc:Hexane) gave 2.19 g (81 %) of the product **8** as a solid.

$^1\text{H}$  NMR ( $\text{CDCl}_3$ , d): 8.06 (m, 2H), 7.2 - 7.75 (m, 16H), 6.67 (d,  $J = 15.8$ , Hz, 1H), 6.23 (dd,  $J = 15.8$ , 7.9 Hz, 1H), 4.63 (m, 1H), 3.46 (m, 1H), 3.1 - 3.3 (m, 2H).

#### EXAMPLE 9

##### 5 Compound 9

To a stirred solution of the b-lactam **8** (2.19 g; 4.7 mmol) in 50 mL of THF at r.t.  
10 is added 1 N NaOH solution (13.6 mL) dropwise. After 2 hours, most of the THF is removed *in vacuo* and 20 mL of 1 N HCl is added. The resulting mixture is extracted with EtAc. The extract is dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated *in vacuo*. The crude product is purified by RPHPLC ( $\text{CH}_3\text{CN}$ :water, 0.1% TFA, 40 - 100 gradient) and the fractions containing product are lyophilized to give 1.1 g  
15 (50%) of carboxylic acid **9** as a white solid.

$^1\text{H}$  NMR ( $\text{CDCl}_3$ , d): 7.18 - 7.97 (m, 18H), 6.61 (d,  $J = 15.8$  Hz, 1H), 6.2 (dd,  $J = 15.8$ , 7.9 Hz, 1H), 5.14 (m, 1H), 3 - 3.22 (m, 3H).

#### EXAMPLE 49

##### Compound **49**

To a stirring solution of the carboxylic acid **48** (120 mg; 0.29 mmol) in 5 mL of dry  $\text{CH}_2\text{Cl}_2$  under  $\text{N}_2$  at room temperature is added triethylamine (0.05 mL; 0.38 mmol). iso-propyl chloroformate (0.38 mL of 1 M solution in toluene) is added dropwise. After 30 minutes, DMAP (18 mg; 0.15 mmol) is added and the mixture allowed to further stir for 1.5 hours at room temperature. The mixture is then diluted with  $\text{CH}_2\text{Cl}_2$  and washed with 1 N HCl. The organic layer is then dried ( $\text{MgSO}_4$ ), filtered and concentrated. The crude product is chromatographed (eluent = 40% EtAc:Hexane to give 44 mg (33 %) of the corresponding isopropyl ester. This compound is then converted to the corresponding amidine **49** via the hydrogen sulfide: methyl iodide: ammonium acetate procedure as described for the conversion of **43** to **44**. The product **49** is purified by RPHPLC and isolated as its trifluoroacetate salt.

## 10 Resolution of Compound 10

Racemic compound **10** (ca. 650 mg, single diastereomer with the presumed syn-stereochemistry shown) is resolved into its two enantiomers **53** (late eluting isomer) and **54** (early eluting isomer) using preparative HPLC

15 (Chiralpak AD column, 50 mm ID x 500 mm, 15 microns). The mobile phase is heptane (A) with 0.1% TFA and i-propanol (B) with 0.1% TFA, isocratic 20% A, 80% B (Flow = 200 mL: minute). The late eluting isomer is isolated by concentration *in vacuo*. The yield is 180 mg. The %ee enantiomer **53** is found to be 100% by analytical HPLC (Chiralpak AD). The <sup>1</sup>H NMR spectra for **53**  
20 and **54** are identical.

<sup>1</sup>H NMR (DMSO-d<sub>6</sub>, d): 8.7 (d, J = 8.6 Hz, 1H), 7.92 (d, J = 9 Hz, 2H), 7.78 (d, J = 9 Hz, 2H), 7.75 - 7.21 (m, 14H), 6.67 (d, J = 16.1 Hz, 1H), 6.4 (dd, J = 16.1, 7.8 Hz, 1H), 4.98 (dd, J = 16.1, 7.8 Hz, 1H), 3.46 (s, 3H), 3.25 - 3.18 (m, 1H), 3.05 -

## EXAMPLE 56

10 Compound **56**

To a solution of N- $\alpha$ -Boc-D-Phenylalanine (38 mmol) in 80 mL of dry tetrahydrofuran is added N-methyl morpholine (38 mmol) in a single portion, followed by isobutyl chloroformate (38 mmol) in a similar fashion, at -20°C. The reaction mixture is stirred for 10 minutes at -20°C and filtered into a preformed ethereal solution of diazomethane (~70 mmol) at 0°C. The resulting solution is allowed to stand at 0°C for 20 minutes. Excess diazomethane is decomposed by the dropwise addition of glacial acetic acid and solvents are removed *in vacuo*.

20

The resulting oil is dissolved in 150 mL of dry methanol. A solution of silver benzoate (8 mmol) in 17 mL of triethylamine is slowly added with stirring, at room temperature. The resulting black reaction mixture is stirred for 45 minutes at room temperature. Methanol is removed *in vacuo* and the residue taken up in 700 mL of ethyl acetate. The mixture is filtered through celite and washed sequentially with saturated sodium bicarbonate (3X150 mL), water (1X150 mL), 1N potassium bisulfate (3x150 mL) and brine (1X150 mL). The organic layer is dried over magnesium sulfate, filtered, concentrated *in vacuo*, and purified by flash chromatography (3:1 hexanes:ethyl acetate).

N-methyl morpholine (1.45 mmol) is added in a single portion, followed by isobutyl chloroformate (1.45 mmol) dropwise via syringe. The reaction mixture is allowed to stir at -20°C for 20 minutes. The reaction mixture is filtered into a solution of sodium borohydride (11 mmol) in 20 mL of water at 0°C. Stirring is continued 1.5 hours at 0°C. The reaction mixture is diluted with 300 mL of ethyl acetate and washed with water (3x100 mL) and brine. The organic phase is dried over magnesium sulfate, filtered, and concentrated. The resulting alcohol is purified by flash chromatography (2:3 ethyl acetate:hexanes).

To a solution of Compound **129** (1 mmol) in 50 mL of dry methanol is added crushed 3Å molecular sieves (approximately 1g). The mixture is stirred for 10 minutes at 0°C and hydrogen chloride gas is bubbled through the reaction mixture for 10 minutes at 0°C. The reaction mixture is allowed to come to room temperature and stirred overnight. Nitrogen gas is bubbled through the reaction mixture for 5 minutes and methanol is removed *in vacuo*. The residue is dried under vacuum to remove all traces of hydrogen chloride, then remixed with 75 mL of dry methanol. The mixture is then cooled to 0°C and ammonia gas is bubbled through the reaction mixture for 10 minutes. The reaction mixture is allowed to come to room temperature, then heated at 60°C for 3 hours. After cooling to room temperature, nitrogen gas is bubbled through the reaction for 5 minutes and the mixture is filtered through celite, concentrated *in vacuo*, and purified by reverse phase HPLC using a gradient of 20% to 80% acetonitrile in water buffered with 0.1% trifluoroacetic acid. Acetonitrile is removed *in vacuo* and the aqueous phase lyophilized to provide the desired product as its trifluoroacetate salt.

Into a solution of Compound 129 (1 mmol) in 20 mL of pyridine and 4 mL of triethylamine is bubbled hydrogen sulfide for 10 minutes at room temperature. The solution is allowed to stir at room temperature overnight. Nitrogen gas is bubbled through the reaction for 5 minutes and solvents are removed *in vacuo*. The residue is dried under vacuum, then dissolved in 15 mL of dry acetone. To this solution is added 5 mL of methyl iodide and this solution is heated at 50°C for 1 hour, then concentrated *in vacuo*. The residue is dissolved in 20 mL of methanol and ammonium acetate (2 mmol) is added in a single portion at room temperature. The reaction mixture is heated at 65°C for 2 hours. After cooling, methanol is removed *in vacuo* and the residue purified by reverse phase HPLC using a gradient of 20% to 80% acetonitrile in water buffered with 0.1% trifluoroacetic acid. Acetonitrile is removed *in vacuo* and the aqueous phase lyophilized to provide the desired product as its trifluoroacetate salt.

## EXAMPLE 198

Compound **198**

To a stirred solution of Compound **197** (2.00 g; 9.21 mmol) in 50 mL of dry tetrahydrofuran (THF) under nitrogen at -78°C is added lithium  
5 hexamethyldisilazane (LHMDS) solution (25.8 mL of 1.0 M solution in THF) dropwise. The mixture is then warmed up to -20 to -25°C for 30 min and then cooled back to -78°C. A solution of 3-cyanobenzyl bromide (4.51 g; 23.0 mmol) in dry THF is then added dropwise and the resulting solution allowed to warm to room temperature.. After 1 hour at room temperature, the mixture is  
10 quenched with saturated NaHCO<sub>3</sub> solution and most of the THF is removed in vacuo. The residue is taken up into CH<sub>2</sub>Cl<sub>2</sub> and washed with water. The organic layer is dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated. The crude product is purified by flash chromatography (eluent = 25% ethyl acetate / Hexanes). The semi-solid residue is then triturated with 20% EtAc / Hexanes and the white

10 The molecules described herein inhibit blood coagulation by virtue of their ability to inhibit the penultimate enzyme in the coagulation cascade, factor Xa, rather than thrombin. Both free factor Xa and factor Xa assembled in the prothrombinase complex (Factor Xa, Factor Va, calcium and phospholipid) are inhibited. Factor Xa inhibition is obtained by direct complex formation between the inhibitor and the enzyme and is therefore independent of the plasma co-

15 factor antithrombin III. Effective factor Xa inhibition is achieved by administering the compounds either by oral administration, continuous intravenous infusion, bolus intravenous administration or any other parenteral route such that it achieves the desired effect of preventing the factor Xa induced formation of thrombin from prothrombin.

20

Anticoagulant therapy is indicated for the treatment and prophylaxis of a variety of thrombotic conditions of both the venous and arterial vasculature. In the arterial system, abnormal thrombus formation is primarily associated with arteries of the coronary, cerebral and peripheral vasculature. The diseases

25 associated with thrombotic occlusion of these vessels principally include acute myocardial infarction (AMI), unstable angina, thromboembolism, acute vessel closure associated with thrombolytic therapy and percutaneous transluminal coronary angioplasty (PTCA), transient ischemic attacks, stroke, intermittent claudication and bypass grafting of the coronary (CABG) or peripheral arteries.

30 Chronic anticoagulant therapy may also be beneficial in preventing the vessel

luminal narrowing (restenosis) that often occurs following PTCA and CABG, and in the maintenance of vascular access patency in long-term hemodialysis patients. With respect to the venous vasculature, pathologic thrombus formation frequently occurs in the veins of the lower extremities following abdominal, knee and hip surgery (deep vein thrombosis, DVT). DVT further predisposes the patient to a higher risk of pulmonary thromboembolism. A systemic, disseminated intravascular coagulopathy (DIC) commonly occurs in both vascular systems during septic shock, certain viral infections and cancer. This condition is characterized by a rapid consumption of coagulation factors and their plasma inhibitors resulting in the formation of life-threatening thrombin throughout the microvasculature of several organ systems. The indications discussed above include some, but not all, of the possible clinical situations where anticoagulant therapy is warranted. Those experienced in this field are well aware of the circumstances requiring either acute or chronic prophylactic anticoagulant therapy.

These compounds may be used alone or in combination with other diagnostic, anticoagulant, antiplatelet or fibrinolytic agents. For example adjunctive administration of factor Xa inhibitors with standard heparin, low molecular weight heparin, direct thrombin inhibitors (i.e. hirudin), aspirin, fibrinogen receptor antagonists, streptokinase, urokinase and/or tissue plasminogen activator may result in greater antithrombotic or thrombolytic efficacy or efficiency. The compounds described herein may be administered to treat thrombotic complications in a variety of animals such as primates including humans, sheep, horses, cattle, pigs, dogs, rats and mice. Inhibition of factor Xa is useful not only in the anticoagulant therapy of individuals having thrombotic conditions but is useful whenever inhibition of blood coagulation is required such as to prevent coagulation of stored whole blood and to prevent coagulation in other biological samples for testing or storage. Thus, any factor Xa inhibitor can be added to or contacted with any medium containing or suspected of containing factor Xa and in which it is desired that blood coagulation be inhibited.

In addition to their use in anticoagulant therapy, factor Xa inhibitors may find utility in the treatment or prevention of other diseases in which the generation of thrombin has been implicated as playing a pathologic role. For example, thrombin has been proposed to contribute to the morbidity and

mortality of such chronic and degenerative diseases as arthritis, cancer, atherosclerosis and Alzheimer's disease by virtue of its ability to regulate many different cell types through specific cleavage and activation of a cell surface thrombin receptor. Inhibition of factor Xa will effectively block thrombin  
5 generation and therefore neutralize any pathologic effects of thrombin on various cell types.

According to a further feature of the invention there is provided a method for the treatment of a human or animal patient suffering from, or subject to,  
10 conditions which can be ameliorated by the administration of an inhibitor of Factor Xa, for example conditions as hereinbefore described, which comprises the administration to the patient of an effective amount of compound of formula I or a composition containing a compound of formula I. "Effective amount" is meant to describe an amount of compound of the present invention effective in  
15 inhibiting Factor Xa and thus producing the desired therapeutic effect.

The present invention also includes within its scope pharmaceutical formulations which comprise at least one of the compounds of Formula I in association with a pharmaceutically acceptable carrier or coating.  
20

In practice compounds of the present invention may generally be administered parenterally, intravenously, subcutaneously intramuscularly, colonically, nasally, intraperitoneally, rectally or orally.

25 The products according to the invention may be presented in forms permitting administration by the most suitable route and the invention also relates to pharmaceutical compositions containing at least one product according to the invention which are suitable for use in human or veterinary medicine. These compositions may be prepared according to the customary  
30 methods, using one or more pharmaceutically acceptable adjuvants or excipients. The adjuvants comprise, inter alia, diluents, sterile aqueous media and the various non-toxic organic solvents. The compositions may be presented in the form of tablets, pills, granules, powders, aqueous solutions or suspensions, injectable solutions, elixirs or syrups, and can contain one or  
35 more agents chosen from the group comprising sweeteners, flavorings, colorings, or stabilizers in order to obtain pharmaceutically acceptable preparations.

The choice of vehicle and the content of active substance in the vehicle are generally determined in accordance with the solubility and chemical properties of the product, the particular mode of administration and the provisions to be observed in pharmaceutical practice. For example, excipients such as lactose, sodium citrate, calcium carbonate, dicalcium phosphate and disintegrating agents such as starch, alginic acids and certain complex silicates combined with lubricants such as magnesium stearate, sodium lauryl sulfate and talc may be used for preparing tablets. To prepare a capsule, it is advantageous to use lactose and high molecular weight polyethylene glycols. When aqueous suspensions are used they can contain emulsifying agents or agents which facilitate suspension. Diluents such as sucrose, ethanol, polyethylene glycol, propylene glycol, glycerol and chloroform or mixtures thereof may also be used.

For parenteral administration, emulsions, suspensions or solutions of the products according to the invention in vegetable oil, for example sesame oil, groundnut oil or olive oil, or aqueous-organic solutions such as water and propylene glycol, injectable organic esters such as ethyl oleate, as well as sterile aqueous solutions of the pharmaceutically acceptable salts, are used. The solutions of the salts of the products according to the invention are especially useful for administration by intramuscular or subcutaneous injection. The aqueous solutions, also comprising solutions of the salts in pure distilled water, may be used for intravenous administration with the proviso that their pH is suitably adjusted, that they are judiciously buffered and rendered isotonic with a sufficient quantity of glucose or sodium chloride and that they are sterilized by heating, irradiation or microfiltration.

Suitable compositions containing the compounds of the invention may be prepared by conventional means. For example, compounds of the invention may be dissolved or suspended in a suitable carrier for use in a nebulizer or a suspension or solution aerosol, or may be absorbed or adsorbed onto a suitable solid carrier for use in a dry powder inhaler.

Solid compositions for rectal administration include suppositories formulated in accordance with known methods and containing at least one compound of formula I.

The percentage of active ingredient in the compositions of the invention may be varied, it being necessary that it should constitute a proportion such that a suitable dosage shall be obtained. Obviously, several unit dosage forms may be administered at about the same time. The dose employed will be determined by the physician, and depends upon the desired therapeutic effect, the route of administration and the duration of the treatment, and the condition of the patient. In the adult, the doses are generally from about 0.01 to about 100, preferably about 0.01 to about 10, mg/kg body weight per day by inhalation, from about 0.01 to about 100, preferably 0.1 to 70, more especially 0.5 to 10, mg/kg body weight per day by oral administration, and from about 0.01 to about 50, preferably 0.01 to 10, mg/kg body weight per day by intravenous administration. In each particular case, the doses will be determined in accordance with the factors distinctive to the subject to be treated, such as age, weight, general state of health and other characteristics which can influence the efficacy of the medicinal product.

The products according to the invention may be administered as frequently as necessary in order to obtain the desired therapeutic effect. Some patients may respond rapidly to a higher or lower dose and may find much weaker maintenance doses adequate. For other patients, it may be necessary to have long-term treatments at the rate of 1 to 4 doses per day, in accordance with the physiological requirements of each particular patient. Generally, the active product may be administered orally 1 to 4 times per day. It goes without saying that, for other patients, it will be necessary to prescribe not more than one or two doses per day.

Compounds within the scope of the present invention exhibit marked pharmacological activities according to tests described in the literature and below which tests results are believed to correlate to pharmacological activity in humans and other mammals.

#### Enzyme Assays:

The ability of the compounds in the present invention to act as inhibitors of factor Xa, thrombin, trypsin, tissue-plasminogen activator (t-PA), urokinase-plasminogen activator (u-PA), plasmin and activated protein C is evaluated by

determining the concentration of inhibitor which resulted in a 50% loss in enzyme activity (IC<sub>50</sub>) using purified enzymes.

5 All enzyme assays are carried out at room temperature in 96-well microtiter plates using a final enzyme concentration of 1 nM. The concentrations of factor Xa and thrombin are determined by active site titration and the concentrations of all other enzymes are based on the protein concentration supplied by the manufacturer. Compounds according to the invention are dissolved in DMSO, diluted with their respective buffers and  
10 assayed at a maximal final DMSO concentration of 1.25%. Compound dilutions are added to wells containing buffer and enzyme and pre-equilibrated for between 5 and 30 minutes. The enzyme reactions are initiated by the addition of substrate and the color developed from the hydrolysis of the peptide-p-nitroanilide substrates is monitored continuously for 5 minutes at 405  
15 nm on a Vmax microplate reader (Molecular Devices). Under these conditions, less than 10% of the substrate is utilized in all assays. The initial velocities measured are used to calculate the amount of inhibitor which resulted in a 50% reduction of the control velocity (IC<sub>50</sub>). The apparent K<sub>i</sub> values are then determined according to the Cheng-Prusoff equation ( $IC_{50} = K_i [1 + [S]/K_m]$ )  
20 assuming competitive inhibition kinetics.

An additional *in vitro* assay may be used to evaluate the potency of compounds according to the invention in normal human plasma. The activated partial thromboplastin time is a plasma-based clotting assay that relies on the  
25 *in situ* generation of factor Xa, its assembly into the prothrombinase complex and the subsequent generation of thrombin and fibrin which ultimately yields the formation of a clot as the assay endpoint. This assay is currently used clinically to monitor the *ex vivo* effects of the commonly used anticoagulant drug heparin as well as direct acting antithrombin agents undergoing clinical  
30 evaluation. Therefore, activity in this *in vitro* assay is considered as a surrogate marker for *in vivo* anticoagulant activity.

#### Human Plasma Based Clotting Assay:

Activated partial thromboplastin clotting times are determined in duplicate on a  
35 MLA Electra 800 instrument. A volume of 100 µl of citrated normal human pooled plasma (George King Biomedical) is added to a cuvette containing 100 µl of a compound according to the invention in Tris/NaCl buffer (pH 7.5) and

placed in the instrument. Following a 3 minute warming period the instrument automatically adds 100  $\mu$ l of activated cephaloplastin reagent (Actin, Dade) followed by 100  $\mu$ l of 0.035 M  $\text{CaCl}_2$  to initiate the clotting reaction. Clot formation is determined spectrophotometrically and measured in seconds.

- 5 Compound potency is quantitated as the concentration required to double a control clotting time measured with human plasma in the absence of the compound according to the invention.

- 10 Compounds according to the invention may also be evaluated for their *in vivo* antithrombotic efficacy in two well established animal experimental models of acute vascular thrombosis. A rabbit model of jugular vein thrombosis and a rat model of carotid artery thrombosis are used to demonstrate the antithrombotic activity of these compounds in distinct animal model paradigms of human venous thrombosis and arterial thrombosis, respectively.

Experimental *In Vivo* Rabbit Venous Thrombosis Model:

- This is a well characterized model of fibrin rich venous thrombosis that is validated in the literature and shown to be sensitive to several anticoagulant drugs including heparin (Antithrombotic Effect of Recombinant Truncated Tissue Factor Pathway Inhibitor (TFPI 1-161) in Experimental Venous Thrombosis-a Comparison with Low Molecular Weight Heparin, J. Holst, B. Lindblad, D. Bergqvist, O. Nordfang, P.B. Ostergaard, J.G.L. Petersen, G. Nielsen and U. Hedner. Thrombosis and Haemostasis, 71, 214-219 (1994). The purpose of utilizing this model is to evaluate the ability of compounds to prevent the formation of venous thrombi (clots) *in vivo* generated at a site of injury and partial stasis in the jugular vein.

- Male and female New Zealand white rabbits weighing 1.5-2 kg are anesthetized with 35 mg/kg of ketamine and 5 mg/kg xylazine in a volume of 1 mL/kg (i.m.). The right jugular vein is cannulated for infusion of anesthetic (ketamine/xylazine 17/2.5 mg/kg/hr at a rate of approximately 0.5 mL/hr) and administration of test substances. The right carotid artery is cannulated for recording arterial blood pressure and collecting blood samples. Body temperature is maintained at 39°C with a GAYMAR T-PUMP. The left external jugular vein is isolated and all side branches along an exposed 2-3 cm of vessel are tied off. The internal jugular vein is cannulated, just above the bifurcation of the common jugular, and the tip of the cannula is advanced just

proximal to the common jugular vein. A 1 cm segment of the vein is isolated with non-traumatic vascular clamps and a relative stenosis is formed by tying a ligature around the vein with an 18G needle just below the distal most clamp. This creates a region of reduced flow and partial stasis at the injury site. The

5 isolated segment is gently rinsed with saline 2-3 times via the cannula in the internal jugular. Thereafter the isolated segment is filled with 0.5 mL of 0.5% polyoxyethylene ether (W-1) for 5 minutes. W-1 is a detergent which disrupts the endothelial cell lining of the segment, thus providing a thrombogenic surface for initiating clot formation. After 5 minutes the W-1 is withdrawn from

10 the segment, and the segment is again gently rinsed with saline 2-3 times. The vascular clamps are then removed, restoring blood flow through this portion of the vessel. Clot formation is allowed to form and grow for 30 minutes after which the vein is cut just below the stenotic ligature and inspected for blood flow (the absence of blood flow is recorded as complete occlusion). The entire

15 isolated segment of vein is then ligated and the formed clot is removed and weighed (wet weight). The effect of test agents on final clot weights is used as the primary end point. Animals are maintained for an additional thirty minutes to obtain a final pharmacodynamic measure of anticoagulation. Drug administration is initiated 15 minutes prior to vascular injury with W-1 and

20 continued through the period of clot formation and maturation. Three blood samples (3 mL ea.) are obtained for evaluation of hemostatic parameters: one just prior to administration of W-1; a second 30 minutes after removal of the vascular clamps and a third at the termination of the experiment. Antithrombotic efficacy is expressed as a reduction in the final clot weight in

25 preparations treated with a compound according to the invention relative to vehicle treated control animals.

The antithrombotic efficacy of factor Xa inhibitors against platelet-rich

Sprague Dawley rats weighing 375-450 g are anesthetized with sodium pentobarbital (50 mg/kg i.p.). Upon reaching an acceptable level of anesthesia, the ventral surface of the neck is shaved and prepared for aseptic surgery. Electrocardiogram electrodes are connected and lead II is monitored throughout the experiment. The right femoral vein and artery are cannulated with PE-50 tubing for administration of a compound according to the invention and for obtaining blood samples and monitoring blood pressure, respectively. A midline incision is made in the ventral surface of the neck. The trachea is exposed and intubated with PE-240 tubing to ensure airway patency. The right carotid artery is isolated and two 4-0 silk sutures are placed around the vessel to facilitate instrumentation. An electromagnetic flow probe (0.95-1.0 mm lumen) is placed around the vessel to measure blood flow. Distal to the probe a 4x4 mm strip of parafilm is placed under the vessel to isolate it from the surrounding muscle bed. After baseline flow measurements are made, a 2x5 mm strip of filter paper previously saturated in 35% FeCl<sub>2</sub> is placed on top of the vessel downstream from the probe for ten minutes and then removed. The FeCl<sub>2</sub> is thought to diffuse into the underlying segment of artery and cause deendothelialization resulting in acute thrombus formation. Following application of the FeCl<sub>2</sub>-soaked filter paper, blood pressure, carotid artery blood flow and heart rate are monitored for an observation period of 60 minutes. Following occlusion of the vessel (defined as the attainment of zero blood flow), or 60 minutes after filter paper application if patency is maintained, the artery is ligated proximal and distal to the area of injury and the vessel is excised. The thrombus is removed and weighed immediately and recorded as the primary end point of the study.

Following surgical instrumentation a control blood sample (B1) is drawn. All blood samples are collected from the arterial catheter and mixed with sodium citrate to prevent clotting. After each blood sample, the catheter is flushed with 0.5 mL of 0.9% saline. A compound according to the invention is administered intravenously (i.v.) starting 5 minutes prior to FeCl<sub>2</sub> application. The time between FeCl<sub>2</sub> application and the time at which carotid blood flow

reached zero is recorded as time to occlusion (TTO). For vessels that did not occlude within 60 minutes, TTO is assigned a value of 60 minutes. Five minutes after application of  $\text{FeCl}_2$ , a second blood sample is drawn (B2). After 10 minutes of  $\text{FeCl}_2$  exposure, the filter paper is removed from the vessel and the animal is monitored for the remainder of the experiment. Upon reaching zero blood flow a third blood sample is drawn (B3) and the clot is removed and weighed. Template bleeding time measurements are performed on the forelimb toe pads at the same time that blood samples are obtained. Coagulation profiles consisting of activated partial thromboplastin time (APTT) and prothrombin time (PT) are performed on all blood samples. In some instances a compound according to the invention may be administered orally. Rats are restrained manually using standard techniques and compounds are administered by intragastric gavage using a 18 gauge curved dosing needle (volume of 5 mL/kg). Fifteen minutes after intragastric dosing, the animal is anesthetized and instrumented as described previously. Experiments are then performed according to the protocol described above.

By way of example, Compound 184 shows  $K_i$  values of 27.0 nM, 1.72  $\mu\text{M}$ , and 2.71  $\mu\text{M}$ , in the Factor Xa, trypsin, and thrombin assays, respectively. Compound 45 shows  $K_i$  values of 94.0 nM, 129 nM, and 477 nM, in the Factor Xa, trypsin, and thrombin assays, respectively. Compound 167 shows  $K_i$  values of 19.0 nM, 46 nM, and 1.228  $\mu\text{M}$ , in the Factor Xa, trypsin, and thrombin assays, respectively.

The present invention may be embodied in other specific forms without departing from the spirit or essential attributes thereof.

## WHAT IS CLAIMED IS:

1. A compound of the formula

$R_1$  and  $R_2$  are hydrogen or taken together are  $=NR_9$ ;

$R_3$  is  $-CO_2R_6$ ,  $-C(O)R_6$ ,  $-CONR_6R_6$ ,  $-CH_2OR_7$  or  $-CH_2SR_7$ ;

$R_4$  is a group of formula

or  $R_4$  is hydrogen, alkyl, cycloalkyl, or cycloalkylalkyl;

$R_5$  is alkyl, alkenyl, optionally substituted aryl or optionally substituted heteroaryl;

$R_6$  is hydrogen or lower alkyl;

$R_7$  is hydrogen, lower alkyl, lower acyl, aroyl or heteroaryl;

$R_8$  is hydrogen or lower alkyl;

$R_9$  is  $R_{10}O_2C-$ ,  $R_{10}O-$ ,  $HO-$ , cyano,  $R_{10}CO-$ ,  $HCO-$ , lower alkyl, nitro, or  $Y^1Y^2N-$ , where  $R_{10}$  is optionally substituted alkyl, optionally substituted aralkyl, or optionally substituted heteroaralkyl, and where  $Y^1$  and  $Y^2$  are independently hydrogen or alkyl;

A and B are hydrogen or taken together are a bond;

Ar is optionally substituted aryl or optionally substituted heteroaryl; and

n is 0, 1 or 2; or

5

a pharmaceutically acceptable salt thereof, an N-oxide thereof, a hydrate thereof or a solvate thereof.

10

2. The compound of claim 1 wherein  $R_1$  and  $R_2$  taken together are =NH.

3. The compound of claim 2 wherein  $R_1$  and  $R_2$  taken together are =NH and form an aminoiminomethyl on the phenyl moiety that is in the meta position to the position of attachment of the phenyl moiety to the propyl moiety.

15

4. The compound of claim 1 wherein  $R_3$  is  $-\text{CO}_2\text{R}_6$ ,  $-\text{CH}_2\text{OR}_7$  or  $-\text{CH}_2\text{SR}_7$ ;

5. The compound of claim 4 wherein  $R_3$  is  $-\text{CO}_2\text{R}_6$  and  $\text{R}_6$  is lower alkyl.

20

6. The compound of claim 4 wherein  $R_3$  is  $-\text{CH}_2\text{OR}_7$  or  $-\text{CH}_2\text{SR}_7$  and  $\text{R}_7$  is hydrogen or lower alkyl.

7. The compound of claim 1 wherein n is 1.

25

8. The compound of claim 1 wherein Ar is optionally substituted aryl.

9. The compound of claim 1 wherein Ar is phenyl.

30

10. The compound of claim 1 wherein  $\text{R}_5$  is optionally substituted phenyl, optionally substituted biphenyl, optionally substituted naphthyl, or optionally substituted heterobiphenyl.

11. A compound according to claim 1 which is:

5

10

5

5

- 5 12. A pharmaceutical composition comprising a pharmaceutically acceptable amount of the compound according to claim 1 and a pharmaceutically acceptable carrier.
- 10 13. A method for treating a disease state capable of being modulated by inhibiting production of Factor Xa to a patient suffering from said disease state an effective amount of the compound according to claim 1.
